## *Crystal field : origin*

### **Hans Bethe (1906-2005)**

In 1929 (University of Tübingen): Model to explain the properties of NaCl crystal.

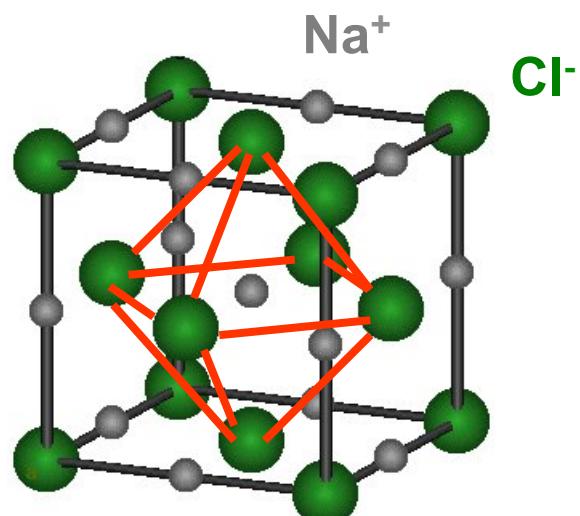

Ions are considered to be undeformable charged spheres and the interaction between them simply results from the electric potential generated by these charges.

(Nobel Prize in Physics 1967)

## Crystal field : origin

NaCl crystal

Na<sup>+</sup> ion surrounded by 6 Cl<sup>-</sup> ions as nearest neighbors

- Ions = indeformable charged spheres
- Interaction results from the created electrostatic potential

Electrostatic potential produced by a negative charge:

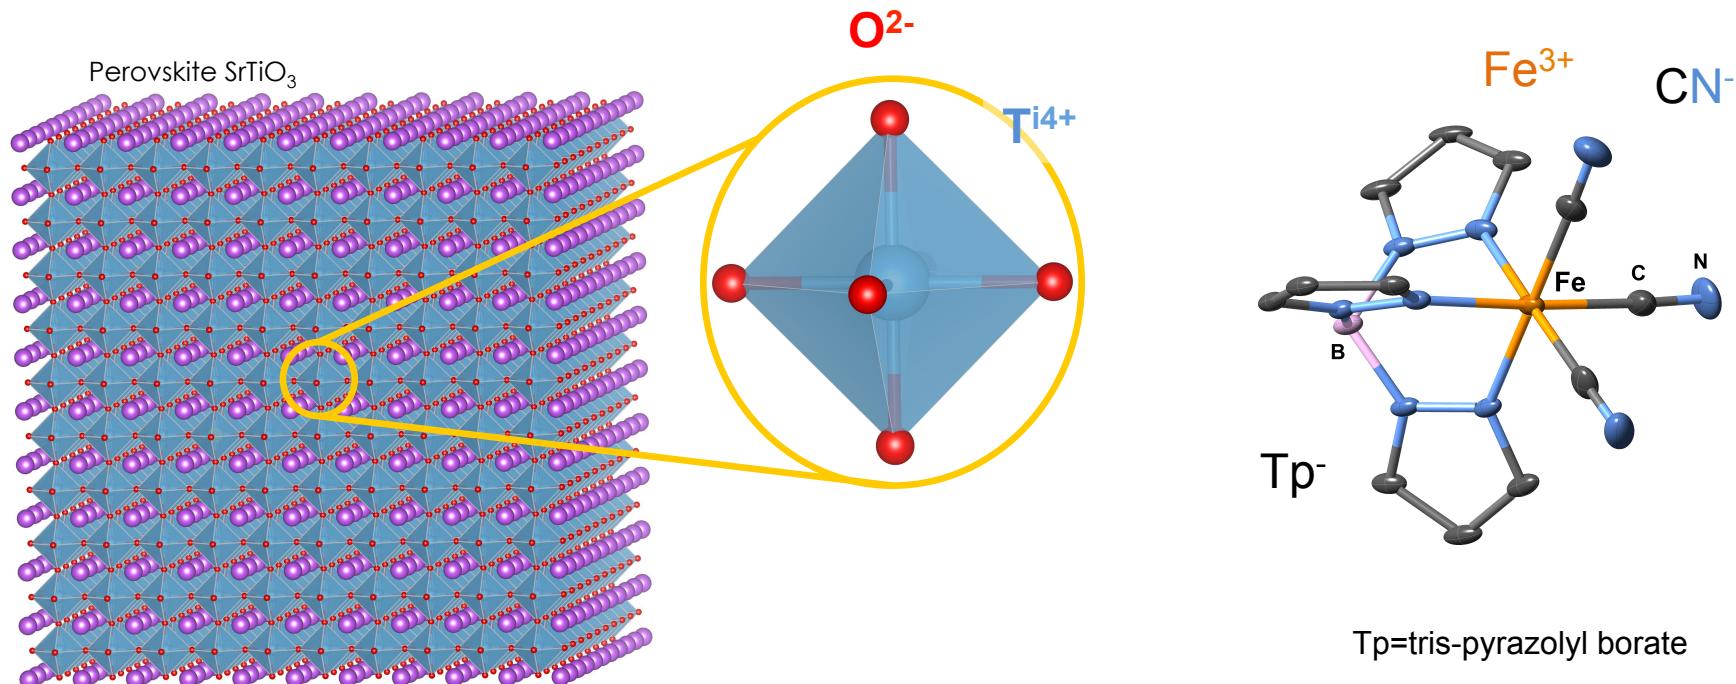

$$V_i = \frac{e}{r}$$

(r = distance between the centered charge and a point i)

Effect of the 6 negative charges:  $\sum_{i=1}^6 V_i$

## Crystal field : origin

Analogy for solid-state or complex coordination  
Consider the ligands and the metal as charged spheres  
 $\text{Na}^+$   $\approx$  metal ion -  $\text{Cl}^-$   $\approx$  ligand

$\text{Tp}^-$ =tris-pyrazolyl borate

# Symmetries

**Symmetry** is responsible for many physical and spectroscopic properties of compounds

**Group theory** is a powerfull tool, which not only allows one to simplify calculations, but also defines the language of labeling states and can predict without calculations if states couple under certain interactions or if certain transitions are allowed or not.

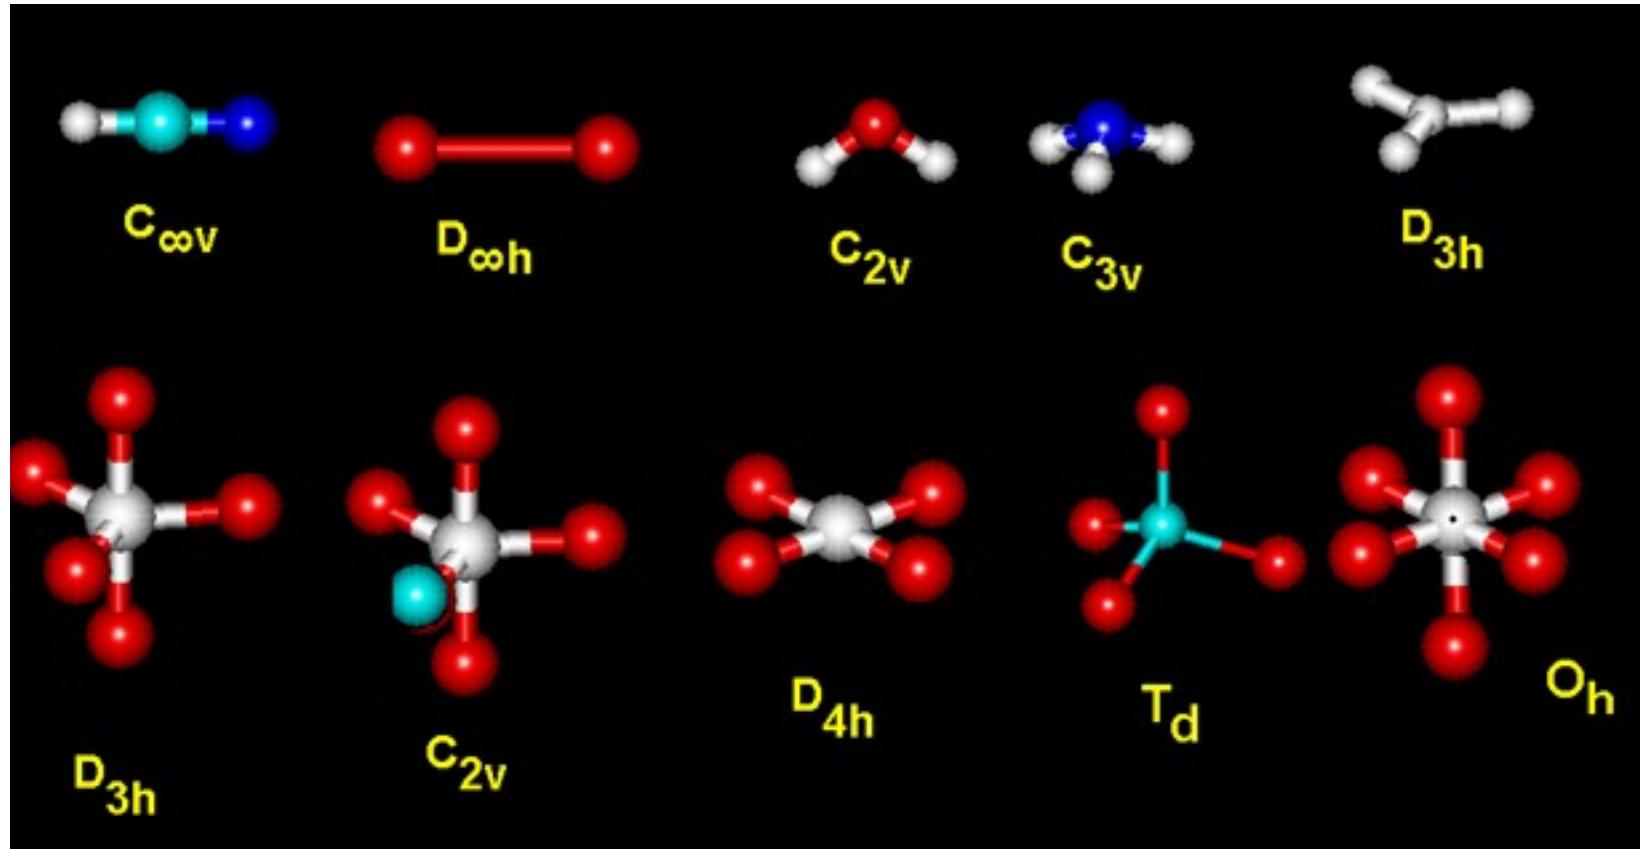

## **Symmetry operations : some notations to know**

- **E**, the identity
- **C<sub>n</sub>**, a rotation by an angle  $2\pi/n$ ;
- **σ** reflection in a plane, classified as
  - **σ<sub>h</sub>**, reflection through a plane perpendicular to the axis of highest rotation symmetry, called *principal axis*
  - **σ<sub>v</sub>**, reflection through a plane to which the principal axis belongs
  - **σ<sub>d</sub>**, reflection through a plane to which the principal axis belongs, and bisecting the angle between the two-fold axes perpendicular to the principal axis.
- **S<sub>n</sub> = σ<sub>h</sub> ⊗ C<sub>n</sub>**, improper rotation of an angle  $2\pi/n$
- **I = S<sub>2</sub>**, the inversion.

# Crystal field hamiltonian and symmetry

All you need is in the web page Quanty.org  
[http://quanty.org/physics\\_chemistry/point\\_groups](http://quanty.org/physics_chemistry/point_groups)

The screenshot shows a Firefox browser window displaying the Quanty.org website. The URL in the address bar is [http://quanty.org/physics\\_chemistry/point\\_groups](http://quanty.org/physics_chemistry/point_groups). The page content is titled "Point groups". A sidebar on the left contains navigation links for Quanty Documentation, Physics and Chemistry, Register, Download area, Copyright, Authors, How to cite, User publications, Questions and answers, Forum, Workshops, Calendar, Heidelberg, Alba, Script versions, Quanty.nb, Quanty.m, Quanty.py, External programs, and CTM4/Crispy. The main content area features a table of point groups categorized by orientation (Nonaxial, Cn, Dn, Cnv, Cnh, Dnh, Dnd, Sn, Cubic, Linear) and symmetry operations (C1, C2, C3, C4, C5, C6, C7, C8, D2, D3, D4, D5, D6, D7, D8, D2h, D3h, D4h, D5h, D6h, D7h, D8h, D2d, D3d, D4d, D5d, D6d, D7d, D8d, S2, S4, S6, S8, S10, S12, T, Td, O, I, Oh, Ih). To the right of the table is a "Table of Contents" box listing sections like Point groups, Different orientations, Symmetry operations, Irreducible representations, Acknowledgements, and Table of contents.

<b>Linear groups</b>	$C_{\infty v}$	$D_{\infty h}$					

The following set of pages list properties of the different point groups and their irreducible representations. The table above links to the main page of each of the different point group. For each group we list the character and product table. Often one needs to answer the question how a potential in a given point group looks like and what the eigen-states of that potential are. The eigen states can be grouped according to the irreducible representations of the group and for each of these representations one can give representing functions. The form of these functions and the potential however do depend on the orientation of the point group. We therefore list for each point group different orientations.

## Different orientations

As we are interested in explicit representations we do need to specify the orientation of the symmetry operators. This results in several tables for the same point group but with different choices for the symmetry operations. For example the cubic  $O_h$  point group can be represented with the  $C_4$  axes in the  $x$ ,  $y$  and  $z$  direction, or with a  $C_3$  axis in the  $z$  direction. We list several orientations of the different point-groups available.

## Symmetry operations

# Crystal field hamiltonian and symmetry

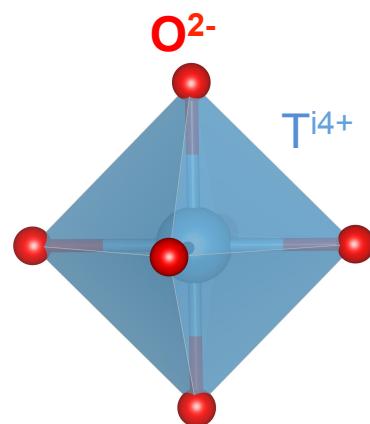

[http://quanty.org/physics\\_chemistry/point\\_groups/oh](http://quanty.org/physics_chemistry/point_groups/oh)

The screenshot shows a Firefox browser window with the following details:

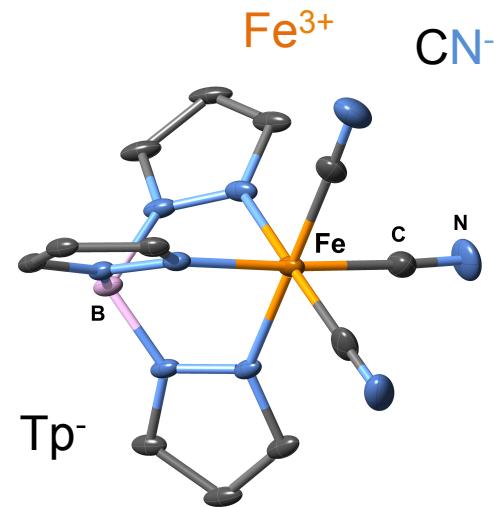

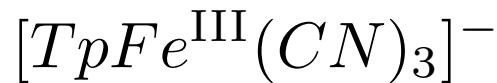

- Address Bar:** quanty.org/physics\_chemistry/point\_groups/oh/orientation\_xyz
- Page Title:** Orientation XYZ - Quanty
- Page Content:**
  - Section Headers:** Article, Talk, Read, Show pagesource, History.
  - Section:** Orientation XYZ
  - Section:** Symmetry Operations
  - Text:** In the Oh Point Group, with orientation XYZ there are the following symmetry operations
  - Diagrams:** Six 3D cube models illustrating symmetry operations:
    - E: Identity operation, cube centered at origin.
    - $C_3$ : Rotation by  $120^\circ$  around a vertical axis passing through the center of the cube.
    - $C_2$ : Rotation by  $180^\circ$  around a horizontal axis passing through the center of the cube.
    - $C_4$ : Rotation by  $90^\circ$  around a vertical axis passing through the center of the cube.
    - $C_2$ : Rotation by  $180^\circ$  around a horizontal axis passing through the center of the cube.
    - i: Inversion through the center of the cube.
  - Table:** A table mapping operators to their orientation vectors.

Operator	Orientation
E	{0, 0, 0},
$C_3$	{1, 1, 1}, {1, 1, -1}, {1, -1, 1}, {-1, 1, 1}, {-1, -1, 1}, {-1, 1, -1}, {1, -1, -1}, {-1, -1, -1},
$C_2$	{1, 1, 0}, {1, -1, 0}, {1, 0, -1}, {1, 0, 1}, {0, 1, 1}, {0, 1, -1},
$C_4$	{0, 0, 1}, {0, 1, 0}, {1, 0, 0}, {0, 0, -1}, {0, -1, 0}, {-1, 0, 0},
$C_2$	{0, 0, 1}, {0, 1, 0}, {1, 0, 0},
i	{0, 0, 0},
$S_4$	{0, 0, 1}, {0, 1, 0}, {1, 0, 0}, {0, 0, -1}, {0, -1, 0}, {-1, 0, 0},
$S_6$	{1, 1, 1}, {1, 1, -1}, {1, -1, 1}, {-1, 1, 1}, {-1, -1, 1}, {-1, 1, -1}, {1, -1, -1}, {-1, -1, -1},
$\sigma_h$	{1, 0, 0}, {0, 1, 0}, {0, 0, 1},

Trigonal  
Group :  $C_{3v}$

## *Crystal field hamiltonian*

## Crystal field hamiltonian

The crystal field potential can be expanded on the normalized spherical harmonics

$$H_{CF} = \sum_{k=0}^{\infty} \sum_{m=-k}^k A_{k,m} C_k^m(\theta, \phi) \quad \text{with } C_{k,m}(\theta, \phi) = \left( \frac{4\pi}{2k+1} \right)^{1/2} Y_{k,m}(\theta, \phi)$$

Where to stop the expansion ?

→ Writing the CF matrix element on the basis functions. Depends on :

$$\langle Y_{\ell_1, m_1} | C_{k,m} | Y_{\ell_1, m_2} \rangle = (-1)^{m_1} (2\ell_1 + 1) \begin{pmatrix} \ell_1 & k & \ell_1 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} \ell_1 & k & \ell_1 \\ -m_1 & m & m_2 \end{pmatrix}$$

$\neq 0$  if  $k$  even ( $2\ell_1 + k$  even),  $0 \leq k \leq 2\ell_1$

$$\langle Y_{\ell_1, m_1} | C_{k,m} | Y_{\ell_2, m_2} \rangle = (-1)^{m_1} \sqrt{(2\ell_1 + 1)(2\ell_2 + 1)} \begin{pmatrix} \ell_1 & k & \ell_2 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} \ell_1 & k & \ell_2 \\ -m_1 & m & m_2 \end{pmatrix}$$

$\neq 0$  if  $\ell_1 + k + \ell_2$  even,  $|\ell_1 - \ell_2| \leq k \leq |\ell_1 + \ell_2|$  and  $-m_1 + m + m_2 = 0$

The crystal fields Hamiltonian thus writes

$$H_{CF} = \sum_{\substack{k=0, \\ k \text{ even}}}^{2\ell} \sum_{m=-k}^k A_{k,m} C_{k,m}(\theta, \phi)$$

with  $\ell$  the orbital momentum of the shell (2 for 3d ions, 3 for 4f ions)

$$A_{k,m} = (-1)^m A_{k,-m}^* \quad (\text{hamiltonian hermitian})$$

## Crystal field hamiltonian and symmetry

$$H_{CF} = \sum_{\substack{k=0, \\ k \text{ even}}}^{\frac{2\ell}{2}} \sum_{m=-k}^k A_{k,m} C_{k,m}(\theta, \phi)$$

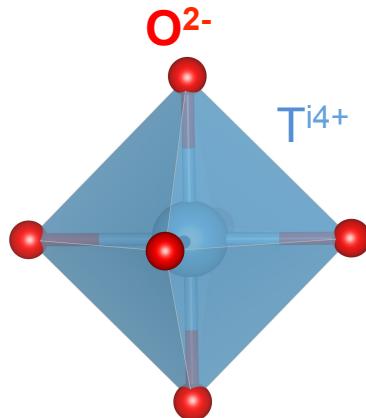

Not all values of  $A_{km}$  are allowed : many are zero due to the symmetry around the ion

Symmetry related:

For all symmetry operation ( $O_i$ ) of the point-group G, we have

$$O_i H_{CF} = H_{CF}$$

Example of the cubic case

$$H_{CF}^{O_h} = A_{4,0} C_4^0 + \sqrt{\frac{5}{14}} A_{4,0} (C_4^{-4} + C_4^4)$$

Only one nonzero  $A_{km}$  :  $A_{40}$

$O_i$		E	8C <sub>3</sub>	6C <sub>2</sub>	6C <sub>4</sub>	3C <sub>2</sub> = (C <sub>4</sub> ) <sup>2</sup>	i	6S <sub>4</sub>	8S <sub>6</sub>	3σ <sub>h</sub>	6σ <sub>d</sub>
A <sub>1g</sub>	1	1	1	1		1	1	1	1	1	1
A <sub>2g</sub>	1	1	-1	-1		1	1	-1	1	1	-1
E <sub>g</sub>	2	-1	0	0		2	2	0	-1	2	0

A <sub>1u</sub>	1	1	1	1		1	-1	-1	-1	-1	-1
A <sub>2u</sub>	1	1	-1	-1		1	-1	1	-1	-1	1
E <sub>u</sub>	2	-1	0	0		2	-2	0	1	-2	0
T <sub>1u</sub>	3	0	-1	1		-1	-3	-1	0	1	1
T <sub>2u</sub>	3	0	1	-1		-1	-3	1	0	1	-1

## **Notations for crystal field parameters**

The notations vary a lot from an author to the other

$$H_{CF} = \sum_{\substack{k=0, \\ k \text{ even}}}^{2\ell} \sum_{m=-k}^k A_{k,m} C_{k,m}(\theta, \phi) \quad (\text{Haverkort/QUANTY})$$

$$H_{CF}(\mathbf{r}) = \sum_{k=0}^{\infty} \sum_{m=-k}^k r^k A_{k,m} C_{k,m}(\theta, \phi) = \sum_{k=0}^{\infty} \sum_{m=-k}^k B_{k,m} C_{k,m}(\theta, \phi)$$

And symmetry dependent parameters like (Balhausen, König, Kremer,...)

$10Dq$  for cubic

$\{10Dq, Ds, Dt\}$  for tetragonal symmetry  $D4h$

.... etc.

## ***3d transitions metal ions***

*In material made of 3d transitions metal ions, a lot of physico-chemical properties are due to the crystal field,*

*For example*

- *Color*
- *Magnetic properties*

## 3d orbitals

- Basis of atomic orbitals

$$\phi_i(\mathbf{r}, \sigma) = \frac{1}{r} P_{n_i \ell_i}(r) Y_{\ell, m}(\theta, \phi) \chi_{m_{s_i}}(\sigma)$$

Radial part

Spin part

$$R_{n_i \ell_i}(r) = \frac{1}{r} P_{n_i \ell_i}(r)$$

Angular part

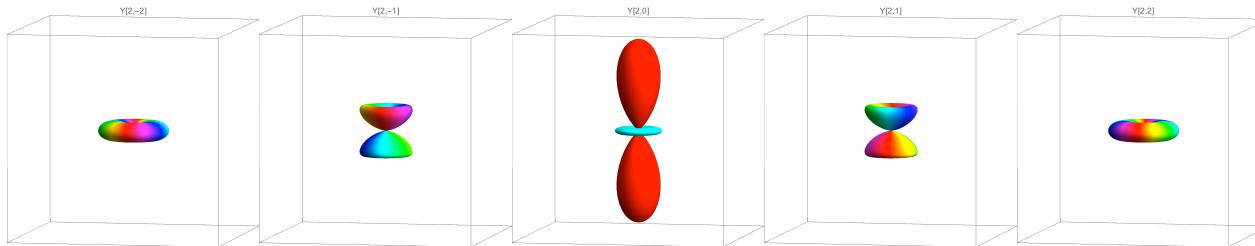

Spherical harmonics

## 3d atomic orbitals

➤ Basis of atomic orbitals       $\phi_i(\mathbf{r}, \sigma) = \frac{1}{r} P_{n_i \ell_i}(r) Y_{\ell, m}(\theta, \phi) \chi_{m_{s_i}}(\sigma)$

➤ 3d levels : n=3,  $\ell=2$        $2\ell+1=5$  basis functions (  $-2 \leq \ell \leq 2$  )

See Quanty/tutorial/hydrogen\_wavefunctions

➤ 3d orbitals are linear combination of  $Y_{2,m}(\theta, \phi)$  with  $m = -2, -1, 0, 1, 2$   
(real harmonics = tesseral harmonics Z)

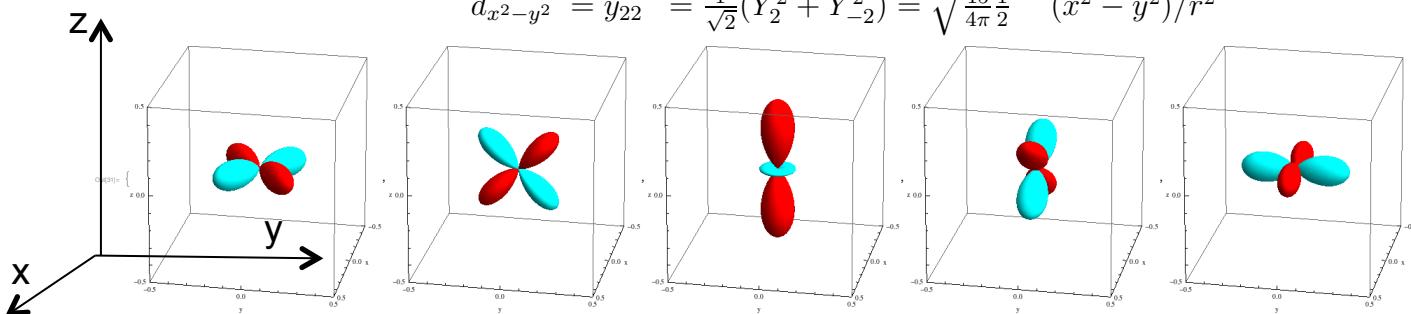

$$d_{xy} = y_{2-2} = \frac{i}{\sqrt{2}}(Y_2^2 - Y_{-2}^2) = \sqrt{\frac{15}{4\pi}} xy/r^2$$

$$d_{yz} = y_{2-1} = \frac{i}{\sqrt{2}}(Y_1^2 + Y_{-1}^2) = \sqrt{\frac{15}{4\pi}} yz/r^2$$

$$d_{3z^2-r^2} = y_{20} = Y_2^0 = \sqrt{\frac{15}{4\pi}} \frac{1}{2\sqrt{3}} (3z^2 - r^2)/r^2$$

$$d_{xz} = y_{21} = \frac{1}{\sqrt{2}}(Y_1^2 - Y_{-1}^2) = \sqrt{\frac{15}{4\pi}} xz/r^2$$

$$d_{x^2-y^2} = y_{22} = \frac{1}{\sqrt{2}}(Y_2^2 + Y_{-2}^2) = \sqrt{\frac{15}{4\pi}} \frac{1}{2} (x^2 - y^2)/r^2$$

# *O<sub>h</sub> crystal field splitting of 3d electron*

$$H_{CF}^{O_h} = A_{0,0}C_{0,0} + A_{4,0}C_{4,0} + \sqrt{\frac{5}{14}}A_{4,0}(C_{4,-4} + C_{4,4}) = 21D_qC_{4,0} + 21\sqrt{\frac{5}{14}}D_q(C_{4,-4} + C_{4,4})$$

## 1) Matrix elements

$$\langle Y_{\ell_1,m_1} | C_{k,m} | Y_{\ell_1,m_2} \rangle = (-1)^{m_1}(2\ell_1+1) \begin{pmatrix} \ell_1 & k & \ell_1 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} \ell_1 & k & \ell_1 \\ -m_1 & m & m_2 \end{pmatrix} = (-1)^{m_1}\sqrt{10/7} \begin{pmatrix} 2 & k & 2 \\ -m_1 & m & m_2 \end{pmatrix}$$

| $\ell m\rangle \equiv |2-2\rangle \quad |2-1\rangle \quad |20\rangle \quad |21\rangle \quad |22\rangle$

CF matrix in {Y<sub>2,m</sub>} basis = 
$$\begin{pmatrix} A_{0,0} + \frac{1}{21}A_{4,0} & 0 & 0 & 0 & \frac{5}{21}A_{4,0} \\ 0 & A_{0,0} - \frac{4}{21}A_{4,0} & 0 & 0 & 0 \\ 0 & 0 & A_{0,0} + \frac{2}{7}A_{4,0} & 0 & 0 \\ 0 & 0 & 0 & A_{0,0} - \frac{4}{21}A_{4,0} & 0 \\ \frac{5}{21}A_{4,0} & 0 & 0 & 0 & A_{0,0} + \frac{1}{21}A_{4,0} \end{pmatrix}$$

## 2) Diagonalization

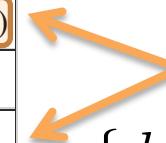

$$\begin{pmatrix} d_{x^2-y^2} & d_{z^2} & d_{yz} & d_{xz} & d_{xy} \\ A_{0,0} + \frac{2}{7}A_{4,0} & 0 & 0 & 0 & 0 \\ 0 & A_{0,0} + \frac{2}{7}A_{4,0} & 0 & 0 & 0 \\ 0 & 0 & A_{0,0} - \frac{4}{21}A_{4,0} & 0 & 0 \\ 0 & 0 & 0 & A_{0,0} - \frac{4}{21}A_{4,0} & 0 \\ 0 & 0 & 0 & 0 & A_{0,0} - \frac{4}{21}A_{4,0} \end{pmatrix}$$

→ The O<sub>h</sub> crystal field split the d orbitals in two groups of orbitals  
 $\{d_{x^2-y^2}, d_{z^2}\}$  and  $\{d_{yz}, d_{xz}, d_{xy}\}$

# *O<sub>h</sub>* Crystal field splitting of 3d electron Use of group symmetry

Character table for O<sub>h</sub> point group

	E	8C <sub>3</sub>	6C <sub>2</sub>	6C <sub>4</sub>	3C <sub>2</sub> = (C <sub>4</sub> ) <sup>2</sup>	i	6S <sub>4</sub>	8S <sub>6</sub>	3σ <sub>h</sub>	6σ <sub>d</sub>	linear, rotations	quadratic
A <sub>1g</sub>	1	1	1	1		1	1	1	1	1		x <sup>2</sup> +y <sup>2</sup> +z <sup>2</sup>
A <sub>2g</sub>	1	1	-1	-1		1	1	-1	1	1	-1

T <sub>2u</sub>	3	0	1	-1		-1	-3	1	0	1	-1	

 $\{d_{x^2-y^2}, d_{z^2}\} \in e_g$   
 $\{d_{yz}, d_{xz}, d_{xy}\} \in t_{2g}$

- From the O<sub>h</sub> group properties, one could have guessed the splitting of the d orbitals
- d orbitals are called e<sub>g</sub> and t<sub>2g</sub> \*

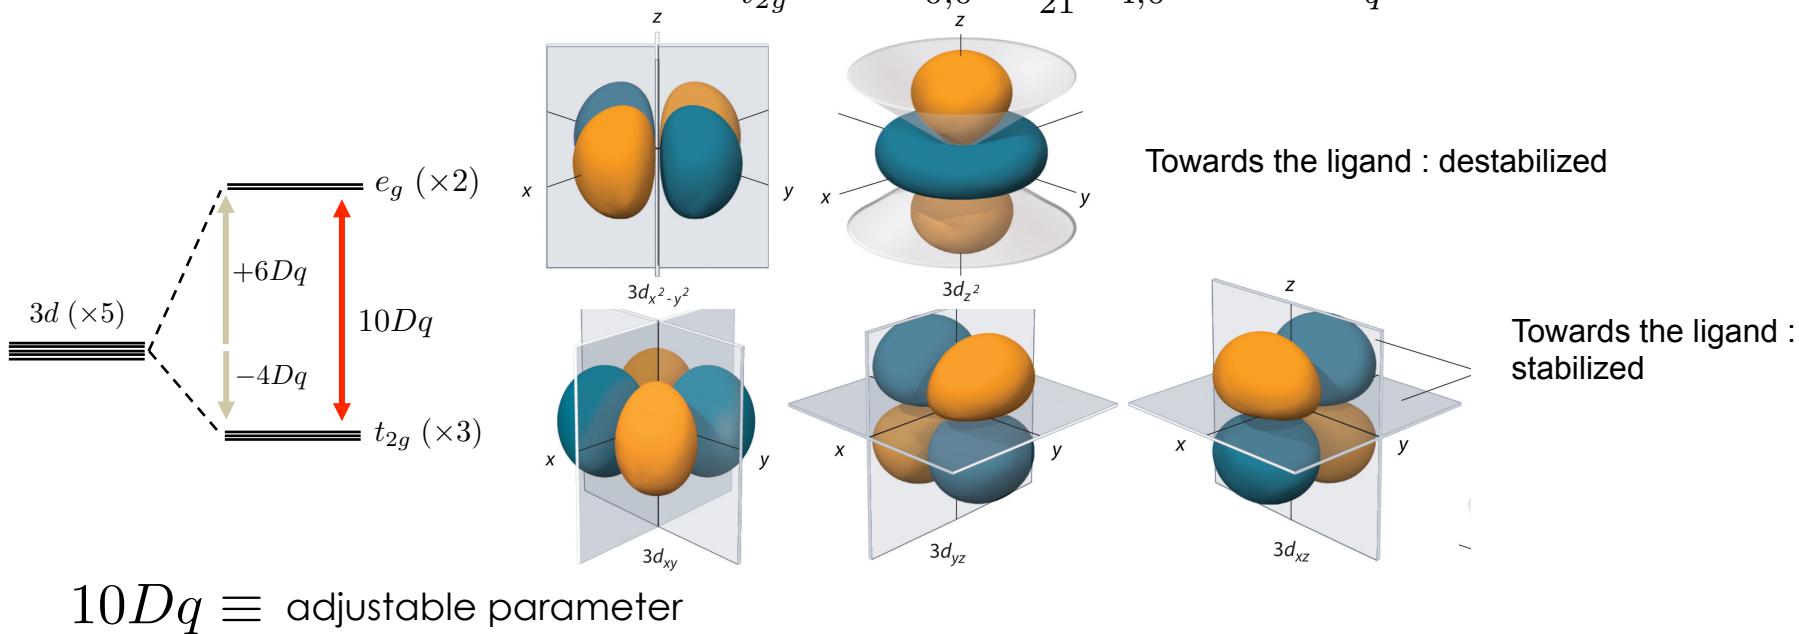

(\*)N.B. : lower case letter (e<sub>g</sub> and t<sub>2g</sub>) for one electron

# $O_h$ Crystal field splitting of 3d electron Parameters

From the diagonalization, one get

$$E_{e_g} = A_{0,0} + \frac{2}{7}A_{4,0} = +6D_q$$

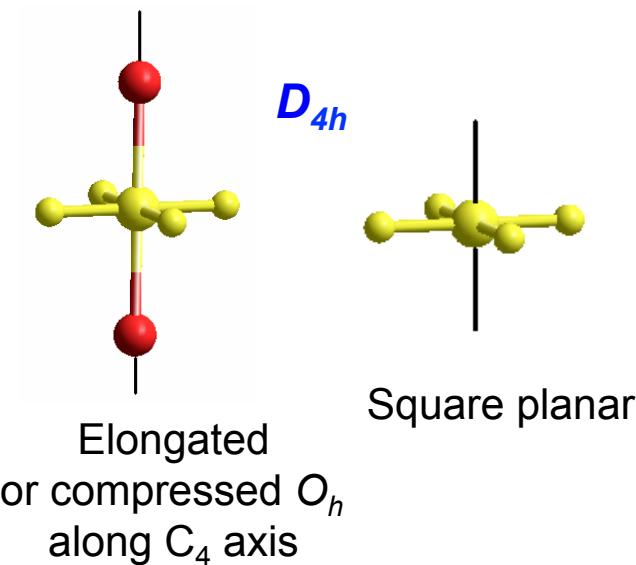

$$E_{t_{2g}} = A_{0,0} - \frac{4}{21}A_{4,0} = -4D_q$$

In QUANTY, the  $A_{k,m}$  are defined in function the orbital energies (this choice can be modified)

$$A_{k,m} = \begin{cases} \frac{2}{5}E_{e_g} + \frac{3}{5}E_{t_{2g}} & k = 0 \quad m = 0 \\ \frac{21}{10}(E_{e_g} - E_{t_{2g}}) & k = 4 \quad m = 0 \\ \frac{21}{10}\sqrt{\frac{5}{14}}(E_{e_g} - E_{t_{2g}}) & k = 4 \quad m = \pm 4 \\ 0 & \text{True} \end{cases}$$

# Tetragonal ( $D_{4h}$ ) crystal field splitting of 3d electron

Character table for  $D_{4h}$  point group

	E	$2C_4$ (z)	$C_2$	$2C'_2$	$2C''_2$	i	$2S_4$	$\sigma_h$	$2\sigma_v$	$2\sigma_d$	linears, rotations	quadratic

From the  $D_{4h}$  table, one can predict the 3d splitting in 4 groups

$$\{d_{z^2}\} \in a_{1g}$$

$$\{d_{x^2-y^2}\} \in b_{1g}$$

$$\{d_{xy}\} \in b_{2g}$$

$$\{d_{xz}, d_{yz}\} \in e_g$$

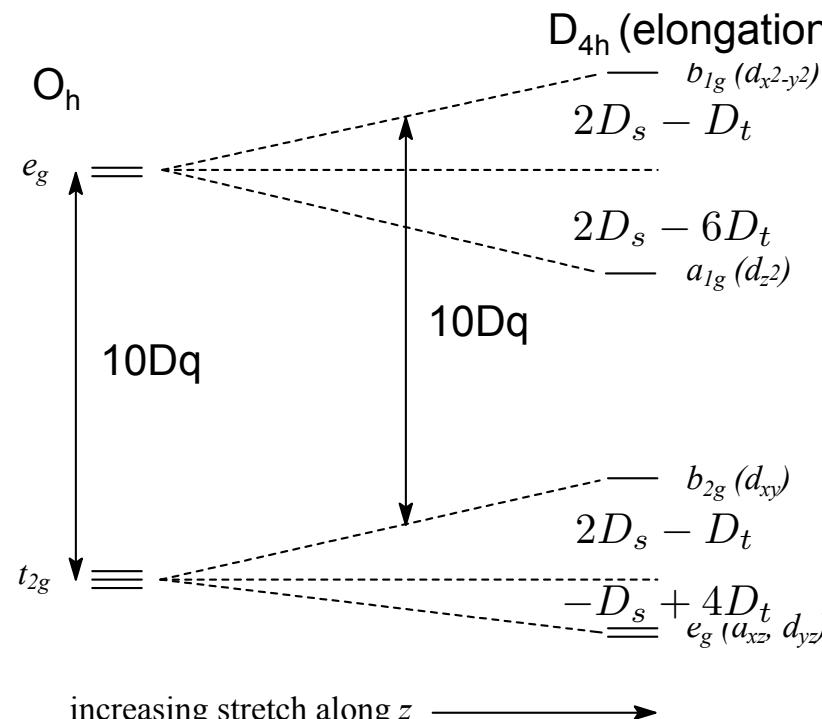

## Tetragonal ( $D_{4h}$ ) crystal field splitting of 3d electron

$$H_{CF}^{D_{4h}} = A_{0,0}C_{0,0} + A_{2,0}C_{2,0} + A_{4,0}C_{4,0} + A_{4,4}(C_{4,-4} + C_{4,4})$$

The CF matrix is diagonal in the {d} basis and the energies are :

$E_{a_{1g}} = 6D_q - 2D_s - 6D_t \quad (d_{z^2})$ $E_{b_{1g}} = 6D_q + 2D_s - D_t \quad (d_{x^2-y^2})$ $E_{b_{2g}} = -4D_q + 2D_s - D_t \quad (d_{xy})$ $E_{e_g} = -4D_q - D_s + 4D_t \quad (d_{xz}, d_{yz})$	<b>with</b> $A_{0,0} = 1/5(E_{a_1} + E_{b_1} + E_{b_2} + 2E_e)$ $A_{2,0} = E_{a_1} - E_{b_1} - E_{b_2} + E_e$ $A_{4,0} = 3/10(6E_{a_1} + E_{b_1} + E_{b_2} - 8E_e)$ $A_{4,4} = A_{4,-4} = 3/20(\sqrt{70}E_{b_1} - \sqrt{70}E_{b_2})$
--	--

The relation with  $Dq, Ds, Dt$  can be found in the book of König&Kremer « Ligand field. Energy diagram »

## Crystal field hamiltonian in QUANTY

$$H_{CF}^{O_h} = A_{0,0}C_{0,0} + A_{4,0}C_{4,0} + \sqrt{\frac{5}{14}}A_{4,0}(C_{4,-4} + C_{4,4}) = 21D_qC_{4,0} + 21\sqrt{\frac{5}{14}}D_q(C_{4,-4} + C_{4,4})$$

### 1) Pre-defined CF potential

```
Akm = PotentialExpandedOnYlm("Oh",2,{0.6,-0.4});  
OppenDq = NewOperator("CF", NFERMION, dIndexUp, dIndexDn, Akm);
```

The Oh potential is defined by:

$$A_{k,m} = \begin{cases} \frac{2}{5}E_{e_g} + \frac{3}{5}E_{t_{2g}} & k=0 \quad m=0 \\ \frac{21}{10}(E_{e_g} - E_{t_{2g}}) & k=4 \quad m=0 \\ \frac{21}{10}\sqrt{\frac{5}{14}}(E_{e_g} - E_{t_{2g}}) & k=4 \quad m=\pm 4 \\ 0 & \text{True} \end{cases}$$

### 1) User made CF potential: Akm = $\{(k_1, m_1, A_{k_1, m_1}), (k_2, m_2, A_{k_2, m_2}), \dots\}$

```
Akm = {{4,0,21/10},{4,-4,21/10sqrt(5/14)}, {4,4,21/10sqrt(5/14)}};  
OppenDq = NewOperator("CF", NFERMION, dIndexUp, dIndexDn, Akm);
```

The parameter is 10Dq and the hamiltonian writes  $H_{CF} = 10Dq * OppenDq$

→ In this Oh case, the hamiltonian is similar but it can be different for lower symmetries ( $E_i(d)$  vs 10Dq,Ds,Dt,...). Anyway, the results should be the same.

## ***Multi-electrons ions***

1. Configuration : simple picture
2. The spherical ion : L,S,J basis function
3. Crystal field : basis functions and matrix element
4. Energy diagram (Tanabe-Sugano)
5. Spectroscopic terms and orbitals
  
6. Example of LS/HS  $\text{Fe}^{2+}$

## Multi-electrons ions : configuration

- Electronic configuration: complete reduced to open shell
- 3d transition metal ions  $1s^2 2s^2 2p^6 \textcolor{red}{3d}^n$   $\textcolor{red}{3d}^n$
- 4f rare earth ions  $1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} \textcolor{red}{4f}^n$   $\textcolor{red}{4f}^n$
- Many possibility of filling of the 3d orbitals
$$\left. \begin{array}{l} 2\ell+1=5 \mid \ell, m_\ell \rangle \text{ angular functions} \\ 2s+1=5 \mid s m_s \rangle \text{ spin functions} \end{array} \right\} 10 \text{ functions}$$
Nb states =  $C_{10}^n = \frac{10!}{n!(10-n)!}$ 

Degeneracy = **multiplets**

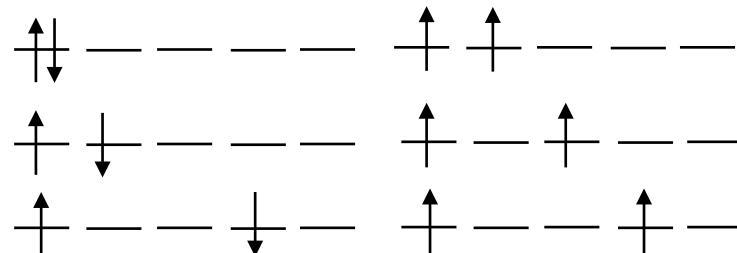

---

Example of a d<sup>2</sup> system (V<sup>3+</sup>, Cr<sup>4+</sup>) :

degenerate states :  $C_{10}^2 = 45$

Some possibilites:

$m_l = -2 \quad -1 \quad 0 \quad 1 \quad 2$

# *Multi-electrons ions configuration and symmetry*

**d<sup>2</sup> ion in O<sub>h</sub> symmetry**

e <sub>g</sub>	— —	— —	↑ —	↓ —
t <sub>2g</sub>	↑↓ — —	↑ +↓ —	↑ — —	↑ — —
Orbital degeneracy	3	6	3x2=6	3x2=6
Spin degeneracy	1 (S=0)	1 (S=0)	3 (S=1)	1 (S=0)

## *Hamiltonian of the ion with N electrons*

$$H_{\text{ion}} = H_{\text{cin}} + H_{e-n} + H_{e-e} + H_{s-o} + H_{\text{CF}}$$

Free ion (spherical)      Crystal field

$$H_{\text{cin}} = \sum_{i=1}^N -\frac{\hbar^2}{2m} \nabla_{r_i}^2 \quad \text{Total kinetic energy}$$

$$H_{e-n} = \sum_{i=1}^N -\frac{Ze^2}{4\pi\epsilon_0 r_i} \quad \text{Coulomb attraction nuclei-electrons}$$

$$H_{e-e} = \sum_{i < j=1}^N \frac{e^2}{4\pi\epsilon_0 r_{ij}} \quad \text{Electron-electron Coulomb repulsions}$$

$$H_{s-o} = \sum_{i=1}^N \xi_i(r_i) \mathbf{l}_i \cdot \mathbf{s}_i \quad \text{Spin-orbit coupling}$$

## *Hamiltonian of the ion with N electrons*

### *Basis functions $|\Psi\rangle$*

- **Multi-electron functions for N electrons**

$$\Psi(r_1, r_2, \dots, r_N)$$

- **Linear combination of Slater determinant built from the mono-electronic functions**
- **Anti-symmetric function to satisfy the Pauli principle**

## Ion with N electrons : operators

- ✓ For N electrons,  $\hat{L} = \sum_{i=1}^N \hat{\ell}_i$    *Sum is coupling*
- ⚠  $\hat{\ell}_i \neq \ell_i$   
 $\hat{\ell}_i$  is the orbit operator defined by  
 $\hat{\ell}_{z,i} |\ell_i m_{\ell_i}\rangle = m_{\ell_i} |\ell_i m_{\ell_i}\rangle$   
 $\hat{\ell}_i^2 |\ell_i m_{\ell_i}\rangle = \ell_i(\ell_i + 1) |\ell_i m_{\ell_i}\rangle$   
 $-\ell_i \leq m_{\ell_i} \leq \ell_i$
- ✓ Same definitions for  $\hat{S}$  and  $\hat{J}$
- ✓  $\hat{J} = \hat{L} \oplus \hat{S}$  operator associated with the spin-orbit coupling  
 $L - S \leq J \leq |L + S|$

## *Free ion with N electrons : basis functions*

### ➤ Fonctions $|\alpha(L,S)JM_J\rangle$

Common eigenfunctions with  $\hat{J}^2, \hat{J}_z, \hat{L}^2, \hat{S}^2$

$H_{cin} + H_{e-n} + H_{e-e} + H_{s-0}$  commute with  $\hat{J}^2, \hat{J}_z, \hat{L}^2, \hat{S}^2$

$(H_{cin} + H_{e-n} + H_{e-e})$  commute with  $\hat{L}^2, \hat{L}_z, \hat{S}^2, \hat{S}_z$ )

- The energy of  $|\alpha(L,S)\rangle$  does not depend on  $M_L, M_S$   
Degeneracy of  $|\alpha(L,S)\rangle = (2L+1)(2S+1)$
- The energy of  $|\alpha(L,S)JM_J\rangle$  does not depend on  $M_J$   
Degeneracy of  $|\alpha(L,S)JM_J\rangle = 2J+1$

**Spectroscopic terms**  $|\alpha(L,S)JM_J\rangle =$

$2S+1 L_J$

S spin

letter for L

$\Gamma=S$  pour  $L=0$

$\Gamma=P$  pour  $L=1$

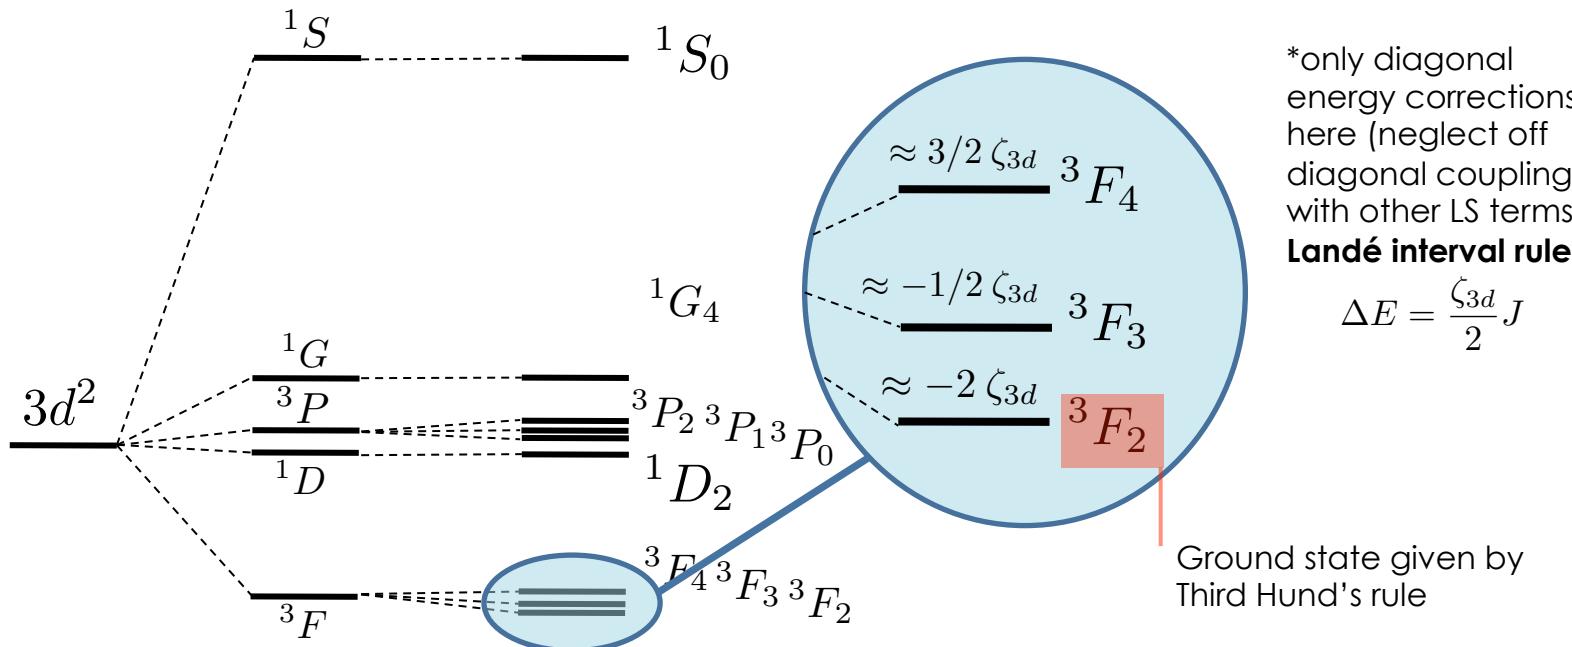

$\Gamma=D$  pour  $L=2$

$\Gamma=F$  pour  $L=3$

## Free ion : spectroscopic terms for $3d^2$ ion

Split the 5 LS terms into 9 (L,S)J terms :

$^1G_4, ^3F_4, ^3F_3, ^3F_2, ^1D_2, ^3P_2, ^3P_1, ^3P_0, ^1S_0$

# *Crystal field : basis function*

- **Basis functions**

Spherical symmetry:

$$|\alpha(L, S) J M_J\rangle$$

Local symmetry around the ion → point group G:

Basis functions of the representations of group G

$$|\alpha(L, S) J \Gamma \gamma\rangle$$

$\Gamma$  irreducible representation of G

$\Gamma\gamma$  basis function of G

- Thole's code uses group theory and the  $\{\Gamma\}$  basis (TTMULT, CTM4XAS)
- QUANTY uses group theory only for crystal field potential building  
does not use the  $\{\Gamma\}$  basis for diagonalization but its knowledge is necessary to label the states (spectroscopic terms)

# Crystal field and group theory

## Free ion

$O_3$  is the group of the sphere  
 $|\alpha(L,S) J M_J\rangle$  partners of irrep\*  $J$  of  $O_3$

$$\mathbf{J}(SO_3) \rightarrow \sum_{M_J=-J}^J \mathbf{M}_J(SO_2)$$

Hamiltonian expanded on  $C_{k,m} \leftrightarrow T^{k,m}$

$$H_{CF} = \sum_{\substack{k=0, \\ k \text{ even}}}^{2\ell} \sum_{m=-k}^k A_{k,m} C_{k,m}(\theta, \phi)$$

## Ion in solid/molecule

$G$  is the subgroup of the sphere  
 $|\alpha(L,S) J \Gamma \gamma\rangle$  partners of the irrep\*  $\Gamma$  of  $G$

$$\mathbf{J}(SO_3) \rightarrow \sum_i \Gamma_i(G)$$

$$ex : \mathbf{2}(SO_3) \rightarrow t_{2g}(O_h) + e_g O_h$$

Hamiltonian expanded on  $C_{k,m} \leftrightarrow T^{k,m}$

$$H_{CF} = \sum_{\substack{k=0, \\ k \text{ even}}}^{2\ell} \sum_i A_{J,\Gamma_i} T_{J,\Gamma_i}$$

$$ex : H_{CF}^{O_h} = a T^{4(SO_3), \textcolor{red}{A_{1g}(O_h)}}$$

$H_{CF}$  is fully symmetric in  $O_h$   
and transforms as  $A_{1g}(O_h)$

\* irrep=irreducible representation

# **Crystal field and group theory**

## **Matrix elements**

$H_{CF} \in A_{1(g)}^*$     (fully symmetric representation of group **G**)  
\*  $g$  only for centro-symmetric group

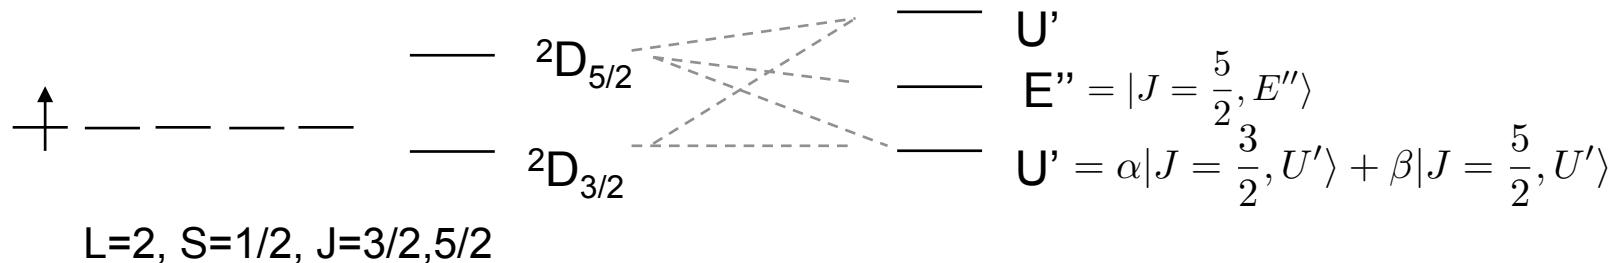

$$\langle (L_i, S_i) J_i \Gamma_i | H_{CF} | (L_j, S_j) J_j \Gamma_j \rangle \neq 0 \quad \text{if} \quad \Gamma_i \otimes A_{1(g)} \otimes \Gamma_j = \boxed{\Gamma_i \otimes \Gamma_j \ni A_{1(g)}}$$

Crystal field mixes  $J$  states if  $\Gamma_i \otimes \Gamma_j \ni A_{1(g)}$

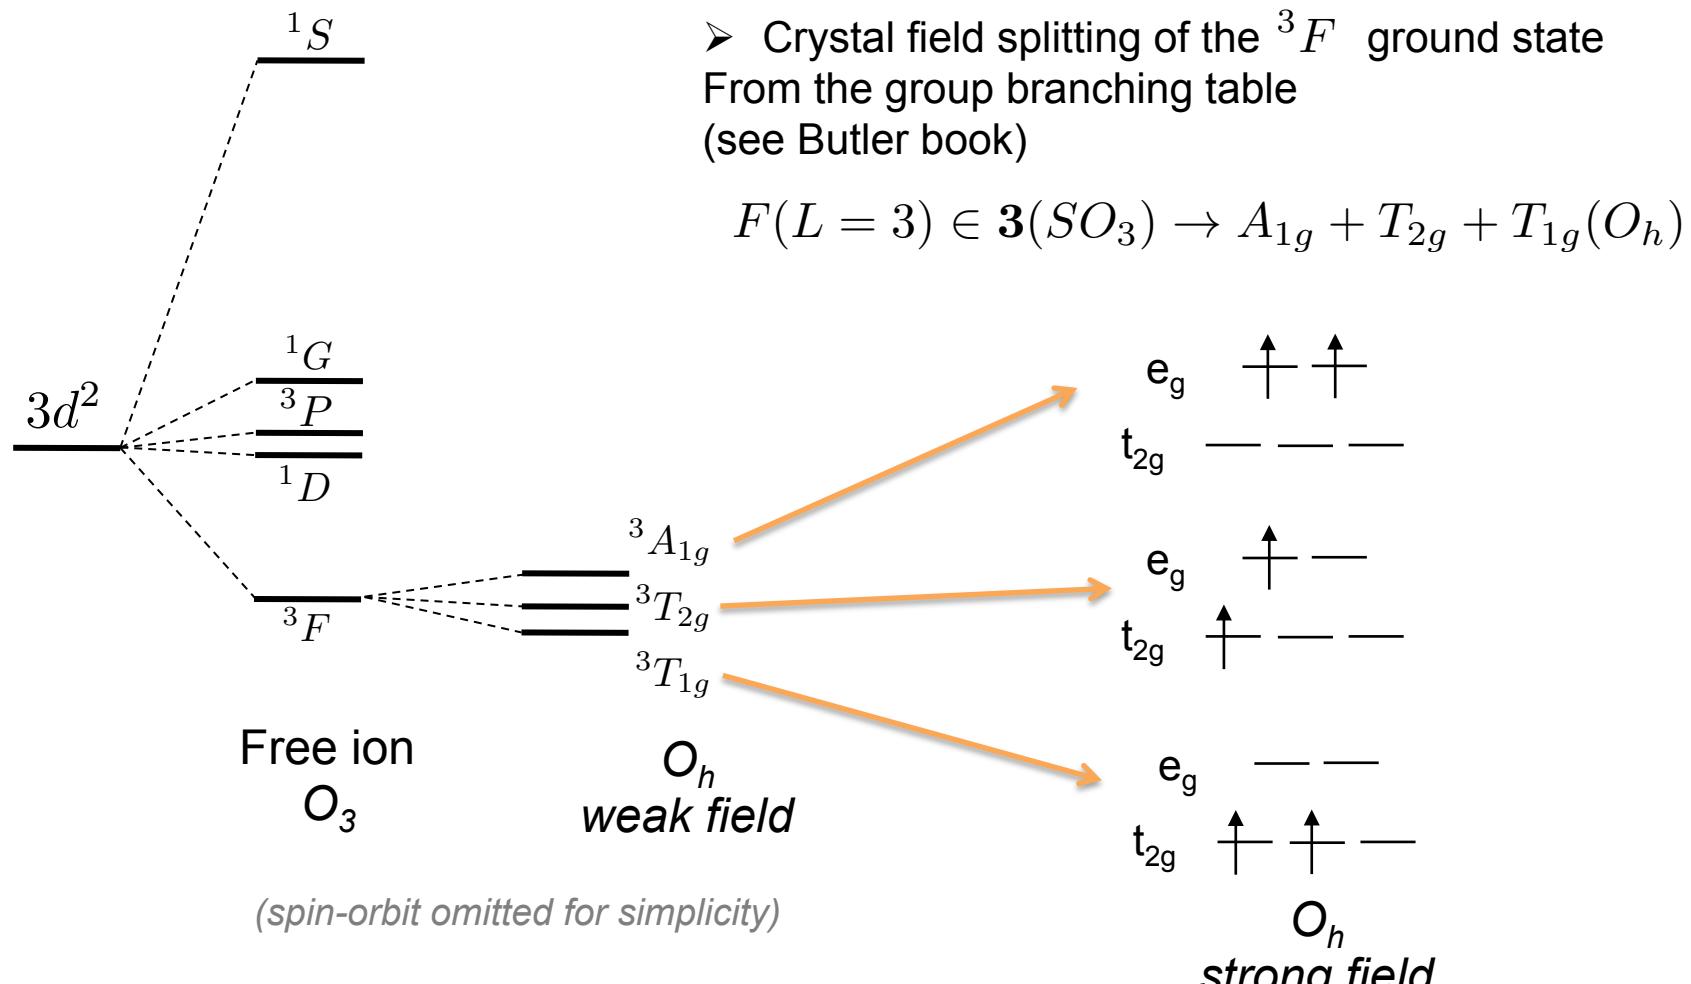

---

Ex:  $d^1$  ( $d^9$ ) ion in  $O_h$  symmetry

# Crystal field and group theory

Example of  $d^2$  ion in  $O_h$  symmetry

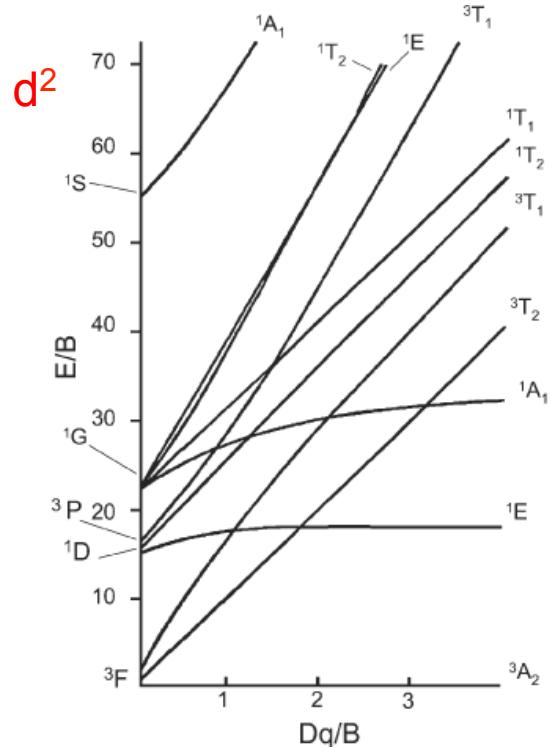

From the multi-electronic state, one can get the electron density on the orbitals of the group (it is not necessary integer)

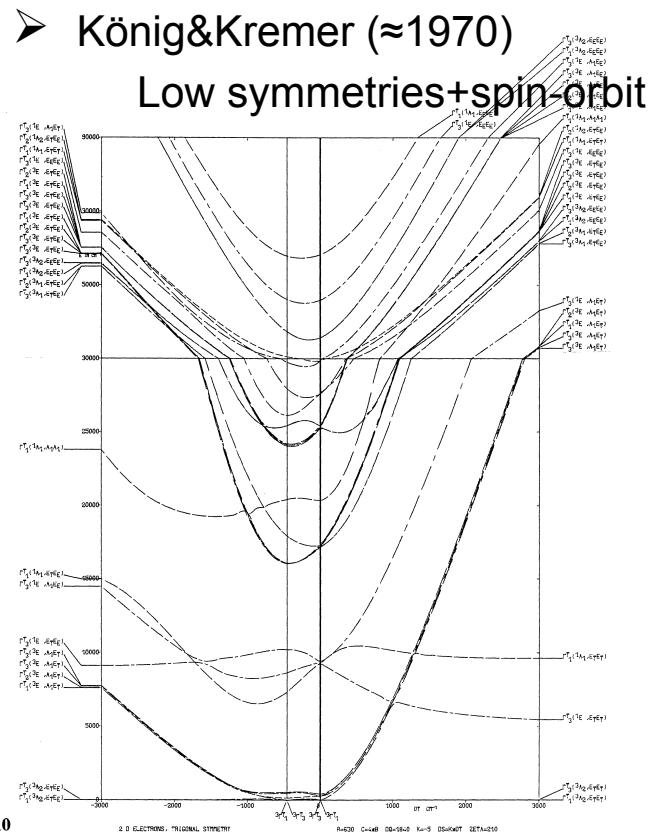

## Crystal field : energy diagram

- Plot of the **energy** of spectroscopic terms ( ${}^{2S+1}\Gamma$  or  ${}^{2S+1}\Gamma_J$ ) as function of **crystal field parameter (10Dq,Ds,...)** (and B Racah parameter (\*))
- Tanabe-Sugano diagram (1954)

$O_h(T_d)$ , no spin-orbit

(\*)B Racah parameters related to the slater integrals (electronic repulsions)

$$A = F^0(3d,3d) - \frac{49}{441}F^4(3d,3d)$$

$$B = \frac{1}{49}F^2(3d,3d) - \frac{5}{441}F^4(3d,3d)$$

$$C = \frac{35}{441}F^4(3d,3d)$$

# **Crystal field : multi-electron and orbitals**

## Multi-electron ions

- **Spectroscopic terms :**  $\Gamma_i \in G$

Term written with capital letter in Mülliken notation. Ex :  $A_{1g}, T_2$   
or Koster notation :  $\Gamma_i$

## Electron density / orbitals

ex :  $e_g^{5.8} t_{2g}^{1.2}$

**L,S,J,M<sub>L</sub>,M<sub>S</sub>,M<sub>J</sub> not « good » quantum numbers.**

Expectation values:

$$\langle \Gamma_i | \hat{O} | \Gamma_i \rangle$$

with  $\hat{O} = L_z, S_z, \dots$

## One electron/orbitals

- **Orbitals :**  $\gamma_i \in G$

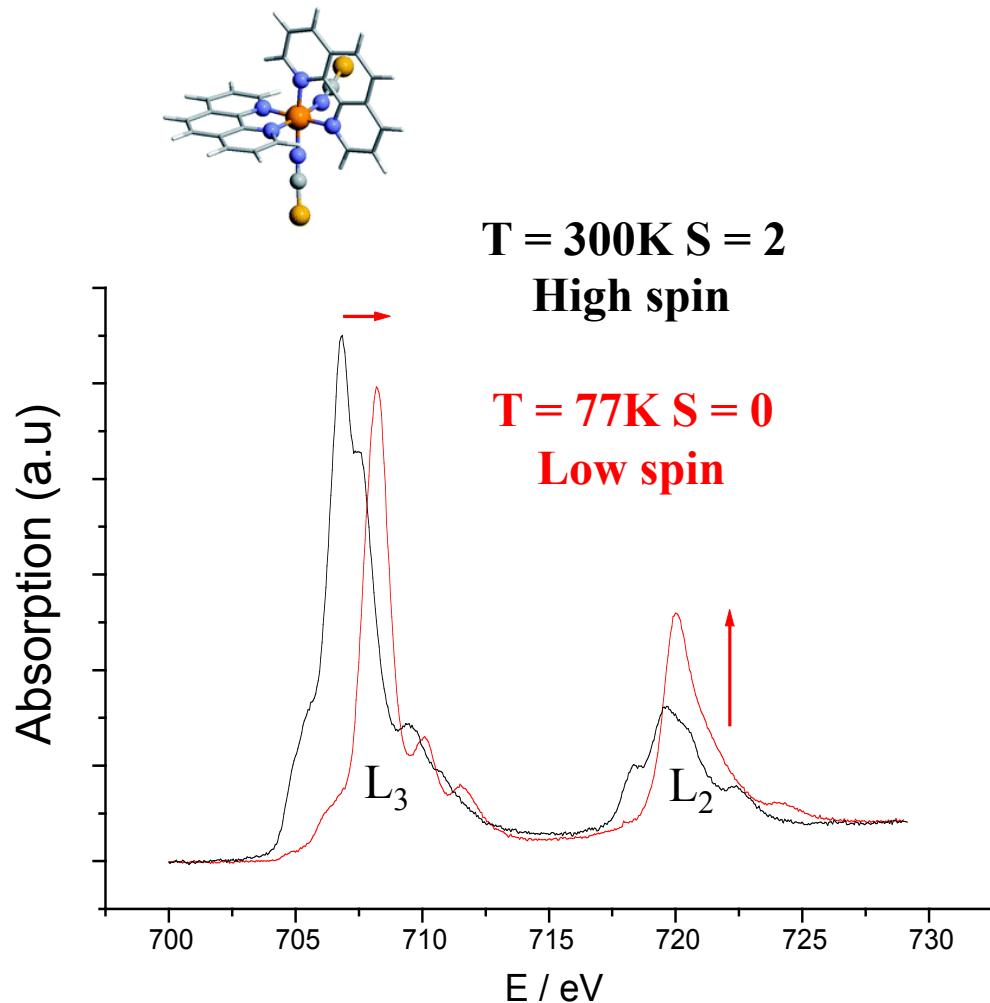

Small letter  
ex:  $a_{1g}, e_2$

## ***Multiplet and crystal field today***

**Calculations including the core-hole** (ex :  $2p^53d^{n+1}$ ,  $3d^94f^{n+1}, \dots$ )  
and many kind of transitions (electric dipole, magnetic dipole...)

- ✓ **RACAH/BANDER**, Thole's code (core of CTM4XAS)  
Based on group theory (Butler "Point group symmetry applications")  
Difficult to modified and adapt to new spectroscopies since Theo Thole died in 1996
- ✓ **QUANTY**, Haverkort's code  
Flexible for the need of the new spectroscopies/physical properties

## *Example of crystal field : spin crossover*

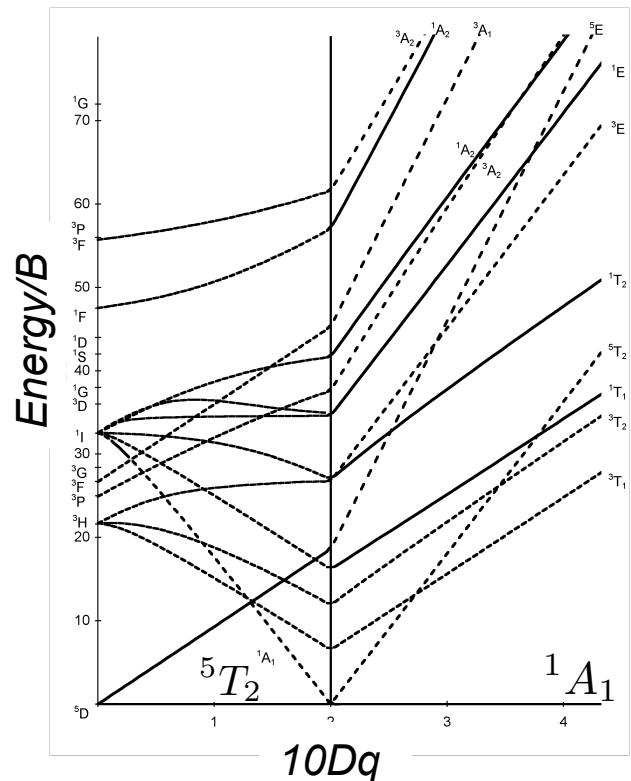

The spin crossover has been intensively studied and observed with many different spectroscopies and magnetic measurements

Ex : XAS at  $L_{2,3}$  edges

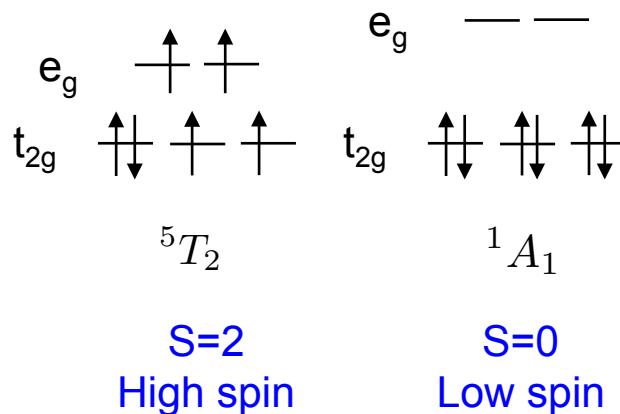

It is a well known crystal field effect named spin crossover

## *Crystal field effect : spin crossover*

Fe<sup>2+</sup> ion (3d<sup>6</sup>) in O<sub>h</sub> symmetry

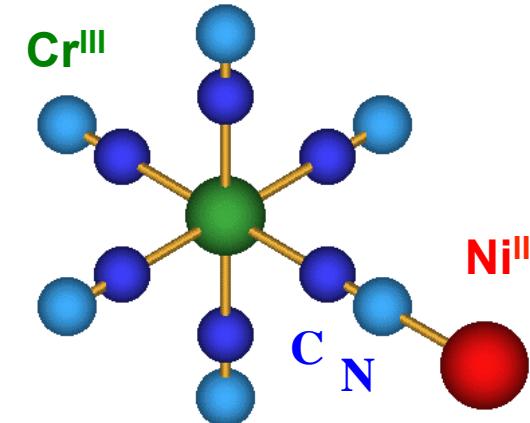

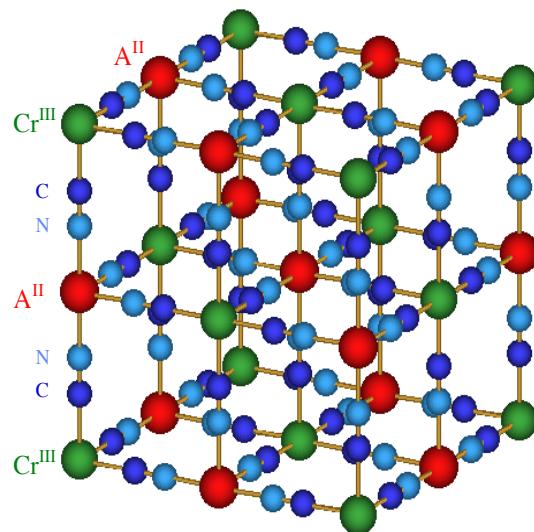

When  $10Dq$  increases, the ground state changes

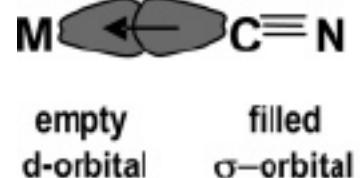

- The magnetic properties goes from paramagnetic to non-magnetic
- Good candidate for many applications like molecular spintronic

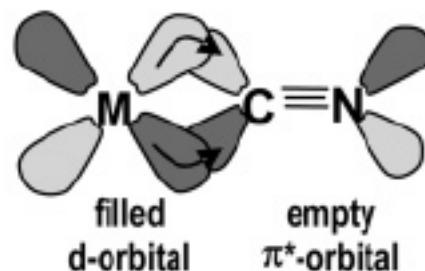

## *Example : prussian blue analogues*

(covalent)  $\text{Cr}^{\text{III}}\text{-C}\equiv\text{N-Ni}^{\text{II}}$  (ionic)

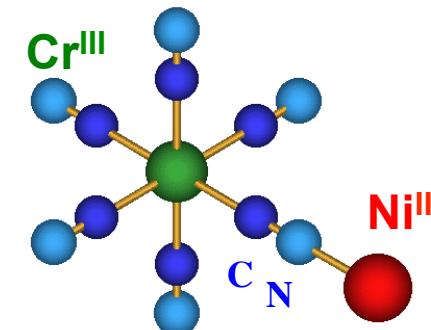

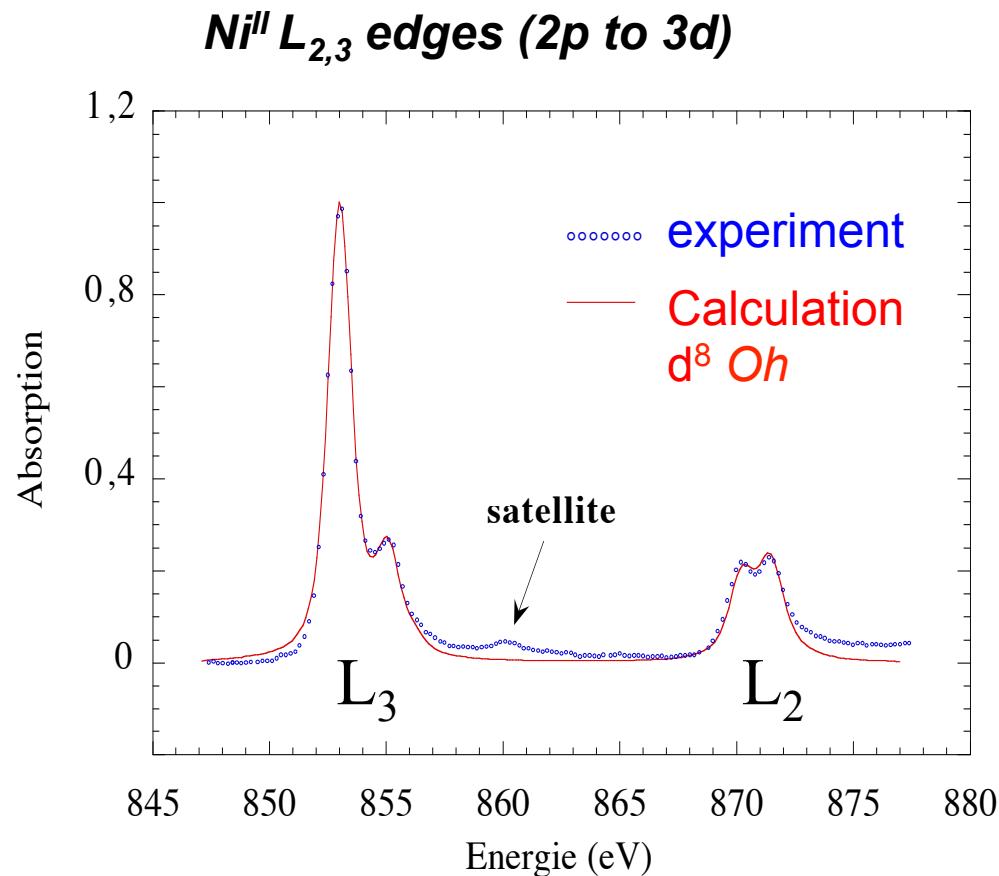

(i)  $\sigma$  donation

(ii)  $\pi$  back-donation

# Weak covalent bond

## CN-Ni<sup>II</sup> in Cs[NiCr(CN)<sub>6</sub>]

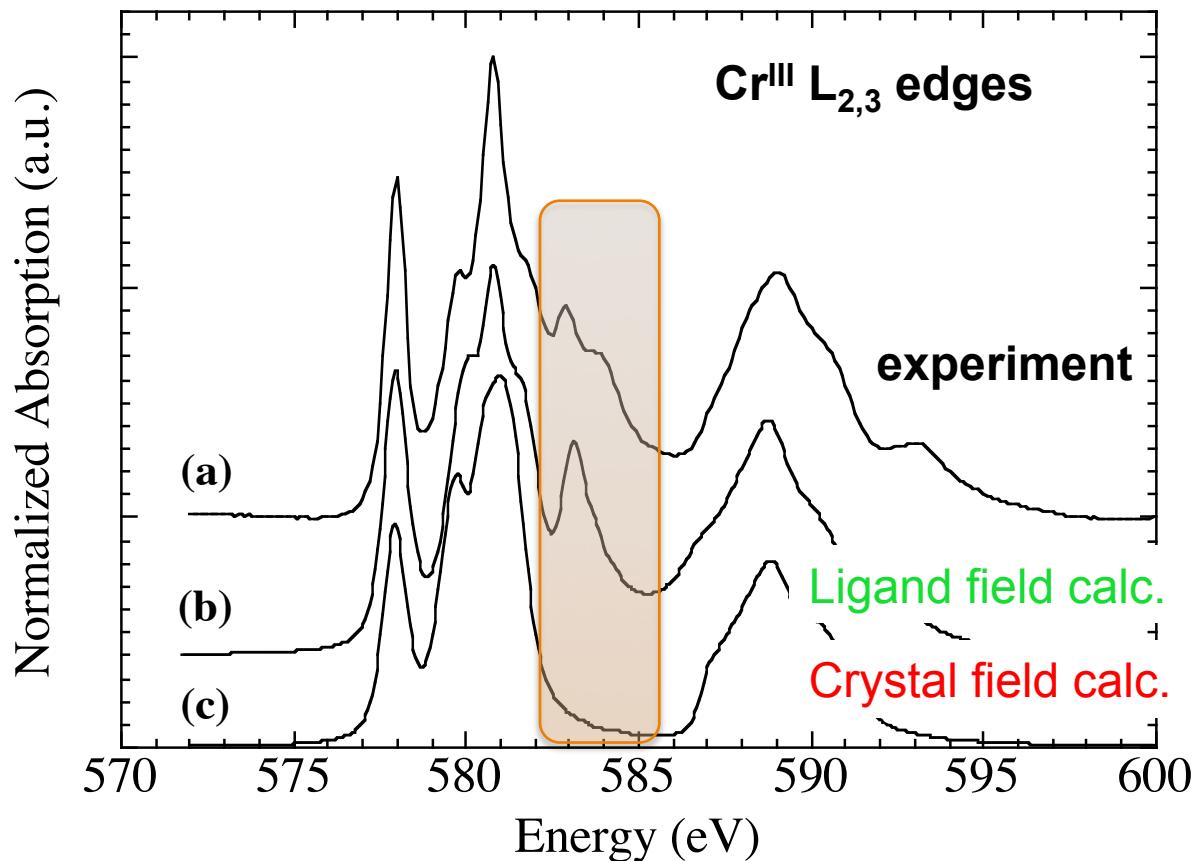

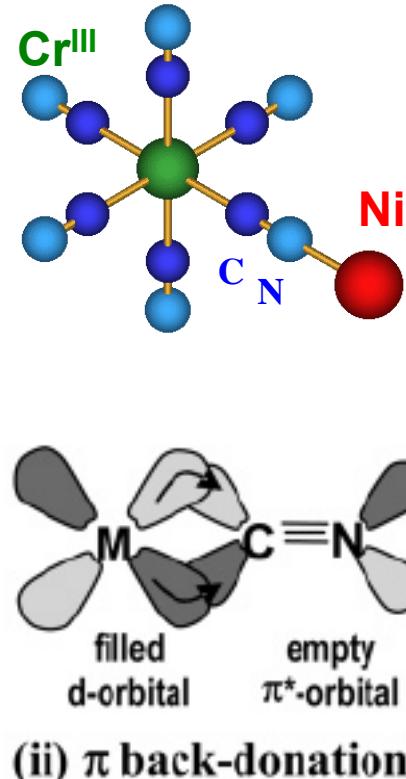

Oh crystal field 10Dq = 1.4 eV  
( ≡ optical spectro.)

$\kappa = 0.8$  (weak covalent bond)

# *Weakness of crystal field theory*

## *Strong crystal field*

- **Crystal field** : Oh, large  $10Dq$  (=3.5eV) + strong slater reduction (50%)  
Incomplete model due to the strong metal to ligand charge transfer
- **Ligand field** : metal to ligand charge transfer  
 $d^3d^0 + d^2d^1$

## ***Crystal field and magnetism***

1. Hamiltonian
2. Magnetic moment (spin and orbit)
3. Zeeman effect / paramagnetism

## **External magnetic field effect : Zeeman effect**

➤ **Hamiltonian**

$$H_{\text{ion}} = H_{\text{cin}} + H_{e-n} + H_{e-e} + H_{s-o} + H_{\text{CF}} + H_{\text{Zeeman}}$$

Free ion (spherical)      Crystal field

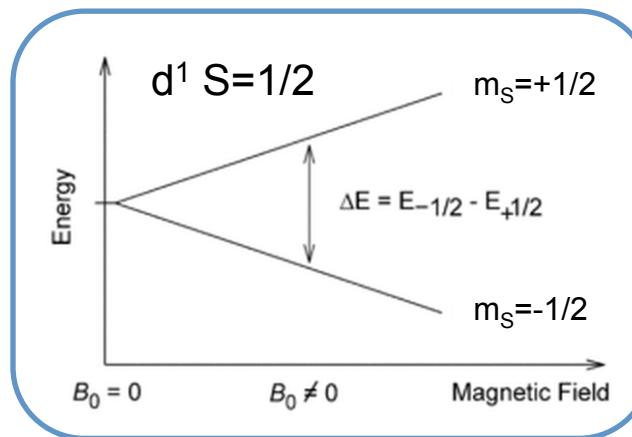

$$\begin{aligned} H_{\text{Zeeman}} &= -\vec{m} \cdot \vec{H} = \mu_B (\hat{L} + g_0 \hat{S}) \cdot \vec{H} \\ &= \mu_B (L_x + 2S_x) H_x + \mu_B (L_y + 2S_y) H_y + \mu_B (L_z + 2S_z) H_z \end{aligned}$$

➤ **Matrix element** depend on the magnetic moment

$$\langle \Gamma_i | H_{\text{Zeeman}} \rangle \Gamma_i = \mu_B (\langle \Gamma_i | L_z | \Gamma_i \rangle + g_0 \langle \Gamma_i | S_z | \Gamma_i \rangle) H_z$$

➡ Splitting of  $\Gamma_i$  states that depends on  $(m_L, m_S)$

1 electron ( $S=1/2$ )  
spherical

## Magnetic moments

➤ Definitions

$$m = m_{\text{orbit}} + m_{\text{spin}}$$

$$m_{\text{orbit}} = -\langle i | \hat{L}_z | i \rangle \mu_B$$

$$m_{\text{spin}} = -g_o \langle i | \hat{S}_z | i \rangle \mu_B = -2 \langle i | \hat{S}_z | i \rangle \mu_B$$

(in  $\hbar$  unit, with  $\mu_B > 0$ )

➤ Crystal field effect:

$|(L,S)J \Gamma \gamma\rangle$  ( $\Gamma$  term) are not eigenfunctions of  $\hat{L}_z$   
 $\langle i | \hat{L}_z | i \rangle \neq m_L$

Linear combination of  $m_L$

---

For 3d ions, the orbital magnetic moment is quenched in most cases.

Some 3d ions have significant orbital magnetic moment ( $\text{Co}^{2+}$ , low spin  $\text{Fe}^{3+}$ ,  $\text{Fe}^{2+}$ )  
→ atomic magnetic anisotropy

## **Magnetic moments**

- QUANTY can calculate the expectation values of any operator ( $\hat{O}$ )  
$$\langle i | \hat{O} | i \rangle$$

Thus one can get the

- Magnetic properties:

Magnetization for a paramagnetic ion in function of  
the temperature T  
the external magnetic field B

Susceptibility

## **Magnetization of paramagnetic 3d ion (Zeeman effect)**

- Magnetic moment of state  $\Gamma_i$

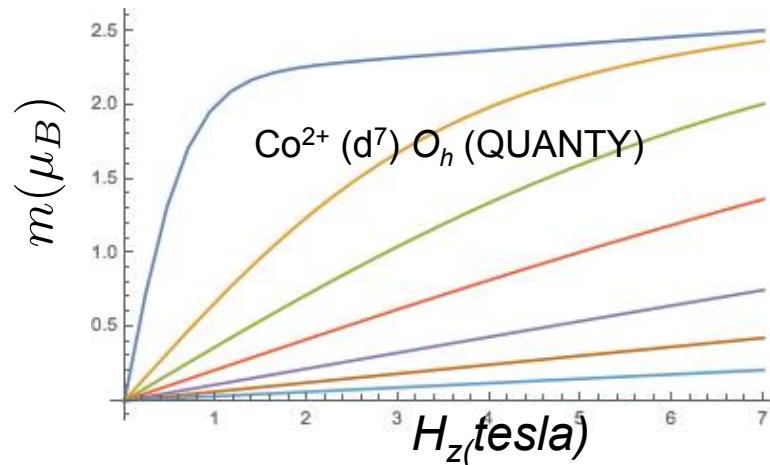

$$m_i = -\langle \Gamma_i | \hat{L}_z + 2\hat{S}_z | \Gamma_i \rangle \mu_B$$

- Magnetic moment at temperature T in the magnetic field  $H_z$

$$m(T, H_z) = \frac{1}{Z} \sum_{i=1}^{Nbstates} m_i e^{-\frac{E_i}{k_B T}}$$

With Z the partition function  $Z = \sum_{i=1}^{Nbstates} e^{-\frac{E_i}{k_B T}}$

- Magnetization curve for a paramagnetic ion  $m(T, H_z) = f(H_z)$

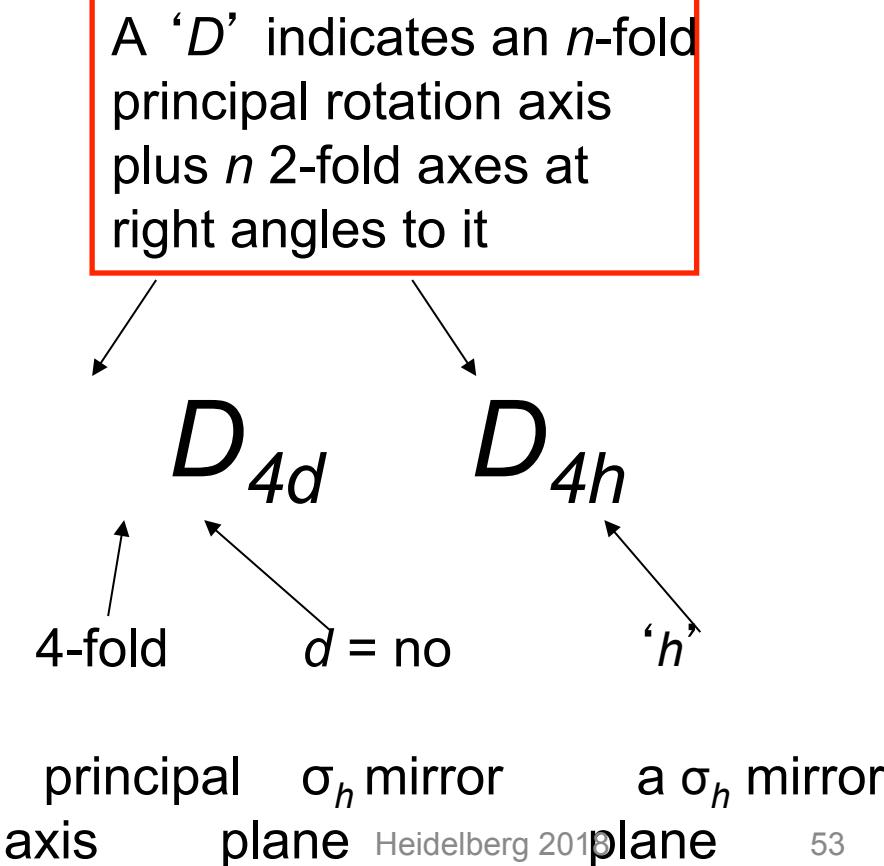

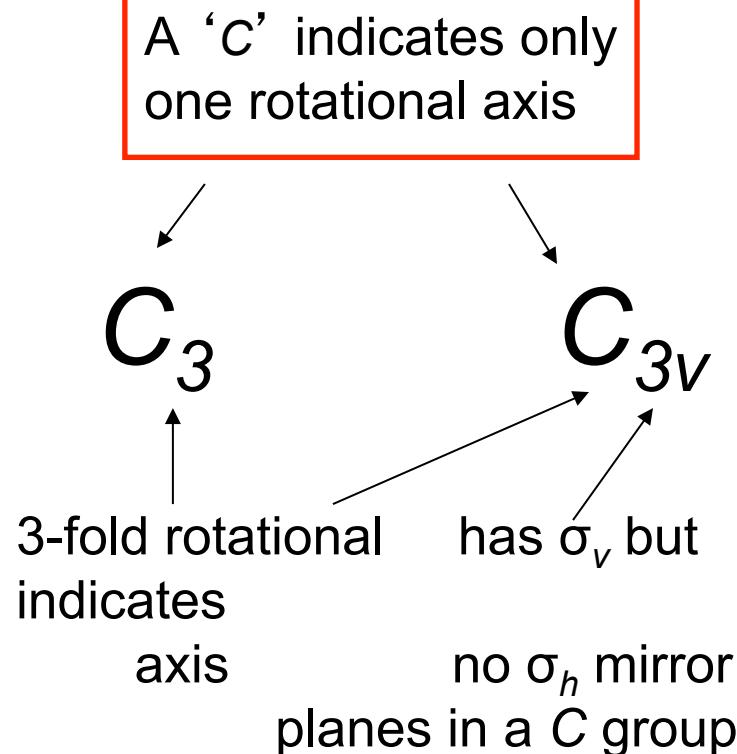

## **Conclusion (remarks)**

- It can be difficult and sometime false to make a single electron model for  $t \rightarrow \text{he}$  multi-electron ion
- Other  $\{d\}$  basis than  $\{d_{xy}, d_{xz}, d_{yz}, d_{z^2}, d_{x^2-y^2}\}$  can be chosen for complex symmetries (ex:  $C_{3v}$ ,  $D_{5d}$ )
- Crystal field is an empirical model (parameter dependent) but it can be linked to more *ab-initio* methods (tight-binding, DFT, CASSCF, ... )  
(Lecture: Maurits Haverkort)
- Crystal field will make angular dependences in transitions (Lecture : Amélie Juhin)
- Crystal field affect the magnetic properties of 4f rare earth ions (not discussed here)

# **Appendix**

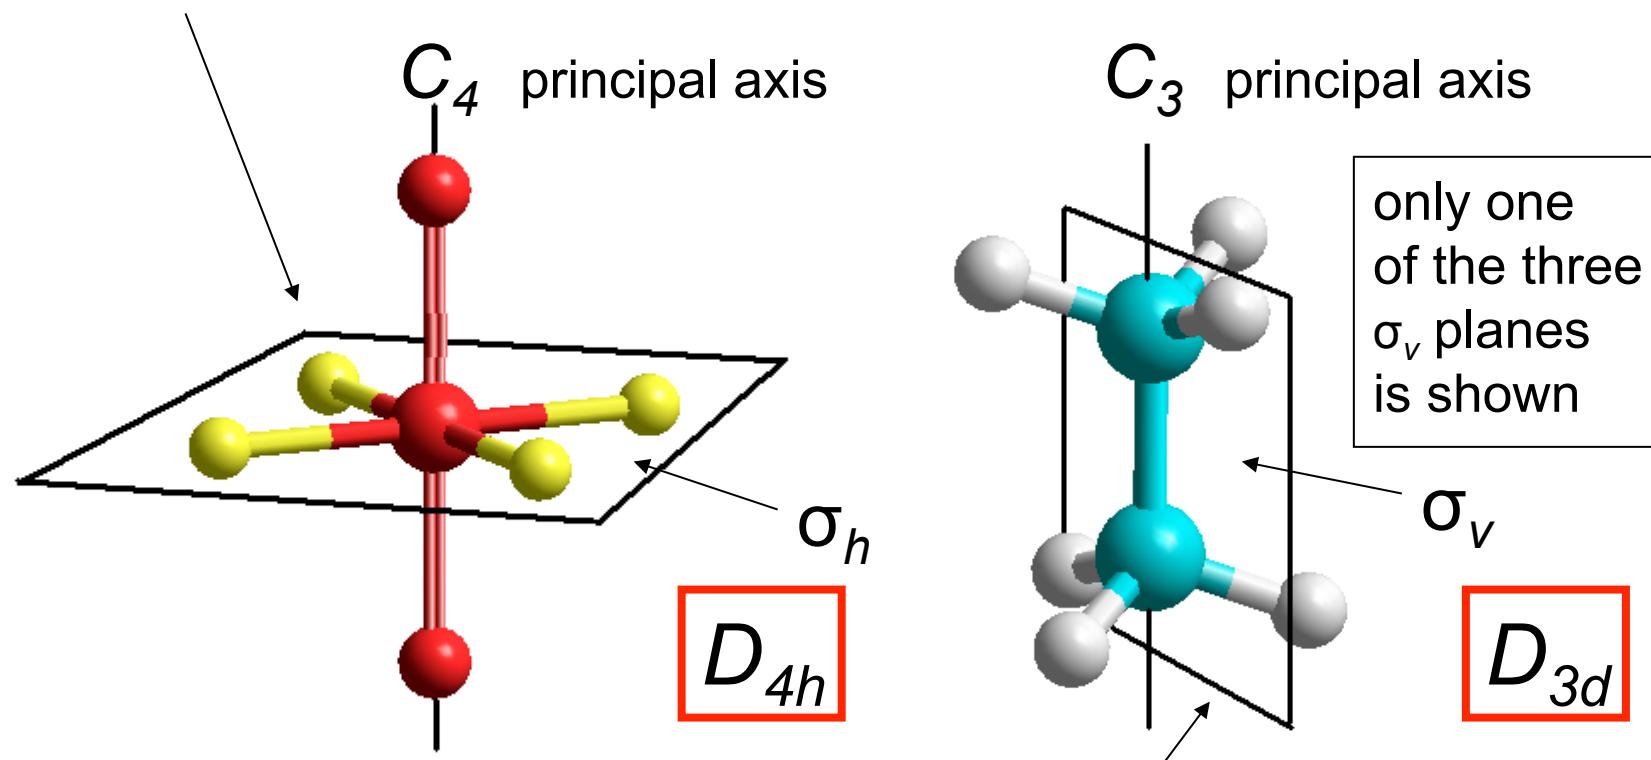

# Naming point groups:

The name of the point group has information about the symmetry elements present. The letter is the **rotational group** and the subscript number after the letter indicates the order of the principal rotational axis (e.g. 3-fold or 4 fold etc.):

## Naming point groups (contd.):

A subscript ‘*h*’ means that there is a  $\sigma_h$  mirror plane at right angles to the *n*-fold principal axis:

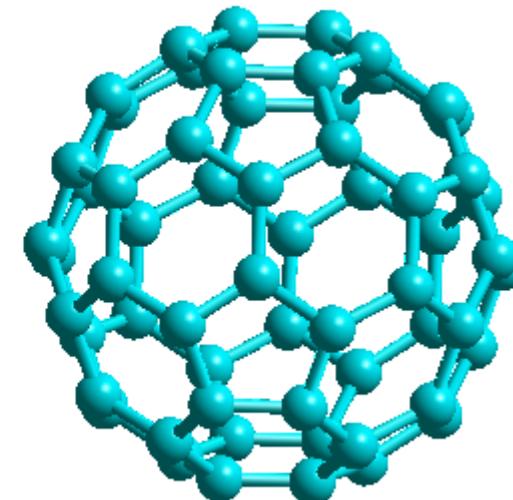

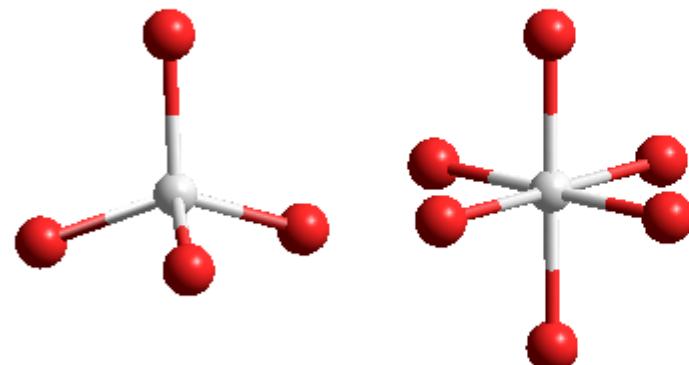

A subscript ‘*d*’ (or *v* for C groups) means there is no  $\sigma_h$  mirror plane, but only *n*  $\sigma_v$  mirror planes containing the principal C<sub>*n*</sub> axis.

# Naming platonic solids:

Platonic solids:

- $T$  = tetrahedral = 4 three-fold axes
- $O$  = octahedral = 3 four-fold axes
- $I$  = icosahedral = 6 five-fold axes

$C_{60}$   
‘bucky-ball’  
or ‘Fullerene’

$T_d$

$O_h$

$I_h$
